Healthy lifestyle behaviours: an overview of recent research and reviews. The effects of health promotion have been the focus of much health promotion research, however, there has been relatively little attention paid to what has been termed 'health-enhancing behaviours', particularly in relation to physical activity. The purpose of this paper is to provide a review of the current research and literature reviews on this topic, focussing on an overview of the current state of knowledge in relation to the effects of the different types of health-enhancing behaviours, including physical activity, sleep, diet and tobacco use. A comprehensive search was conducted using electronic databases (Medline, Cinahl, PsychINFO, Web of Knowledge, EMBASE, Cochrane Database of Systematic Reviews, Cochrane Central Register of Controlled Trials) and hand-searches of journals, conference proceedings and the reference lists of retrieved literature. Three reviews and a number of primary research papers were identified. The current evidence suggests that health-enhancing behaviours reduce the risk of several chronic diseases. However, the type of health behaviour, such as physical activity, sleep or diet, also appears to be important, as is the context in which they are undertaken, thus factors such as social support play an important role in encouraging people to engage in health-enhancing behaviours. Recent studies also suggest that health-enhancing behaviours are associated with many other health related variables, such as self-esteem, anxiety, self-efficacy and others. There is a significant lack of longitudinal research in this area, however, the current evidence does suggest that the effects of health-enhancing behaviours on morbidity and mortality are clear and significant. Opinion: Five reasons that Mitt Romney would be a great leader for
